

AI Model Comparison

[Clear](#)

Compare OpenAI, Gemini and Llama side by side.

Your Prompt

Find the bug.

```
function add(a,b){  
  return a-b;  
}
```

47/2000

💡 Tip: Use the exact same prompt for a fair comparison.

[Submit](#)**OpenAI**

gpt-4.1

[OpenAI](#)

Response

Yes, there is a bug in your function. The function name is `add`, so it should **add** two numbers. But in your function body, you're **subtracting** them.

Here's the buggy code:

```
```javascript  
function add(a, b) {
 return a - b;
}
```
```

Correction:

You should use the addition operator (`+`):

```
```javascript  
function add(a, b) {
 return a + b;
}
```

```
}
...

Summary:
- **Bug:** Used `-` instead of `+`.
- **Fix:** Change `a - b` to `a + b`.
```

Model: gpt-4.1 | Time: 1.73s

**Google Gemini**

gemini-3.5-flash

Google Gemini

**Response**

The bug is in the math operator inside the function.

The function is named `add`, but it is currently performing **subtraction** (`-`) instead of **addition** (`+`).

### Corrected Code:

```
```javascript  
function add(a, b) {  
  return a + b;  
}  
...`
```

Response

Step-by-step analysis of the problem:

1. **Function Name and Purpose**: The function is named `add`, which suggests that

its purpose is to add two numbers together.

2. **Function Implementation**: However, the function implementation is ``return a - b;``, which is actually subtracting ``b`` from ``a``.

3. **Inconsistency**: The function name and implementation are inconsistent. The function is supposed to add two numbers, but it's actually performing subtraction.

Fixed solution:

```
```\njavascript\n/**\n * Adds two numbers together.\n *\n * @param {number} a The first number to add.\n * @param {number} b The second number to add.\n * @returns {number} The sum of a and b.\n */\nfunction add(a, b) {\n  return a + b; // Changed - to + to fix the bug\n}\n```\n
```

# Explanation of changes:

\* **Changed operator**: Changed the operator from ``-`` (subtraction) to ``+`` (addition) to fix the inconsistency between the function name and implementation.

\* **Added documentation**: Added a JSDoc comment to provide a description of the function, its parameters, and its return value.

# Tests and example uses:

```
```\njavascript\nconsole.log(add(2, 3)); // Expected output: 5\nconsole.log(add(-1, 1)); // Expected output: 0\nconsole.log(add(0, 0)); // Expected output: 0\n```\n
```
